Bomb-Blast Hardware
made by

Sobinco Hardware Technology

Based upon the Chrono Safe Tilt-Turn system, the Sobinco Bomb-Blast system combines both the luxury of a tilt-turn window and the security of a fixed window. For applications where a high level of blast protection is mandatory, the Sobinco Bomb-Blast system adds the benefit of having a natural ventilation option.

The operation of the system can be controlled via a keyed handle. Systems can be fully locked-out to prevent unwanted operation or limited to closed and ventilation mode without any need for a key.

When the system is fully closed, the system has passed both large missile impact testing and live-fire bomb blast testing. Each system is custom designed for your application. For more information contact Bronze Craft Engineering.

Mushroom Head Locking Points

Constructed from stainless steel for strength and durability, the geometry of the locking points ensures proper locking during a dynamic impact.

Encapsulated Keepers

In the locked position, the keeper fully restricts any extraneous motion of the locking point to provide maximum locking force under a high load impact.
